PRACTICE LAB ASSIGNMENT

5.1.1 STACKED PLOT

Create a stacked area plot to visualize the temperature variations for three different cities (City A, City B, and City C) across the months of the year. The temperature data is provided for each city in the editor.

Your task is to:

- Create a stacked area plot using the data.
- Label the x-axis as "Month", the y-axis as "Temperature", and provide the title "Temperature Variation" for the plot .
- Display the plot showing the temperature variation for each city throughout the months of the year.

INPUT

```
import matplotlib.pyplot as plt
import pandas as pd

# Data for Months and Temperature for three cities
data = {
    'Month': ['January', 'February', 'March', 'April', 'May', 'June', 'July', 'August', 'September',
             'October', 'November', 'December'],
    'City_A_Temperature': [5, 7, 10, 13, 17, 20, 22, 21, 18, 12, 8, 6],
    'City_B_Temperature': [2, 3, 5, 6, 10, 14, 16, 17, 12, 9, 5, 3],
    'City_C_Temperature': [3, 4, 6, 8, 9, 12, 15, 14, 10, 7, 4, 2]
}

# Write your code...
df = pd.DataFrame(data)
plt.stackplot(df['Month'],df['City_A_Temperature'],df['City_B_Temperature'],df['City_C_Temperature'])
plt.xlabel('Month')
plt.ylabel('Temperature')
plt.title('Temperature Variation')
plt.show()
```

LAB ASSIGNMENT

5.2.1 TITANIC DATASET

Write a Python program to analyze and visualize data from the Titanic dataset based on the following instructions:

Dataset Information:
The dataset is stored in a CSV file named `titanic.csv` and has been loaded using the `pandas` library. It contains the following columns:

- `Pclass`: Passenger class (1 = First, 2 = Second, 3 = Third).
- `Gender`: Gender of the passenger (male/female).
- `Age`: Age of the passenger.
- `Survived`: Survival status (0 = Did not survive, 1 = Survived).
- `Fare`: Ticket fare paid by the passenger.

Visualization:
To represent these trends, you will create 5 visualizations using `Matplotlib`. The visualizations should be arranged in a 3x2 grid (3 rows and 2 columns).

Visualization Details:
Write the code to create a series of visualizations as follows:

- Bar Plot (`Pclass` Distribution):
- Create a bar plot to show the distribution of passengers across the different passenger classes (`Pclass`).
 - Use the color `skyblue` for the bars.
 - Title the plot as "Passenger Class Distribution".
 - Label the x-axis as "`Pclass`" and the y-axis as "Count".

- Pie Chart (`Gender` Distribution):
- Create a pie chart to display the distribution of male and female passengers.
 - Use `lightblue` for males and `lightcoral` for females.
 - Include percentages on the slices (use `autopct='%1.1f%%'`).
 - Title the plot as "Gender Distribution".

- Histogram (`Age` Distribution):
- Create a histogram to visualize the distribution of passengers' ages.
 - Use `lightgreen` for the bars with black edges (`edgecolor = 'black'`).
 - Set the number of bins to 8 for the histogram.
 - Title the plot as "Age Distribution".
 - Label the x-axis as "`Age`" and the y-axis as "Frequency".

- Bar Plot (`Survival` Count):
- Create a bar plot to show the count of passengers who survived and those who did not, based on the `Survived` column.
 - Use the colors `lightblue` for survivors (1) and `lightcoral` for non-survivors (0).
 - Title the plot as "Survival Count".
 - Label the x-axis as "Survived (0 = No, 1 = Yes)" and the y-axis as "Count".

- Scatter Plot (`Fare` vs `Age`):
- Create a scatter plot to visualize the relationship between the `Fare` and `Age` of passengers.
 - Use `orange` for the data points.
 - Title the plot as "Fare vs Age".
 - Label the x-axis as "`Age`" and the y-axis as "`Fare`".

Note: Refer to the displayed plot in the sample test cases for better understanding.

INPUT

```
import pandas as pd
import matplotlib.pyplot as plt

# Load the Titanic dataset from the CSV file
df = pd.read_csv('titanic.csv')

# Set up the figure for 5 subplots
fig, axes = plt.subplots(3, 2, figsize=(12, 12))

# write the code..

# Plot 1: Count of passengers byclass
axes[0,0].bar(df['Pclass'].value_counts().index,df['Pclass'].value_counts(),color='skyblue')
axes[0, 0].set_title("Passenger Class Distribution")
axes[0, 0].set_xlabel("Pclass")
axes[0, 0].set_ylabel("Count")

# Plot 2: Gender distribution
axes[0, 1].pie(df['Gender'].value_counts(),
labels=df['Gender'].value_counts().index, autopct='%1.1f%%',
colors=['lightblue', 'lightcoral'])
axes[0, 1].set_title("Gender Distribution")

# Plot 3: Age distribution
axes[1, 0].hist(df['Age'].dropna(),bins=8, color='lightgreen', edgecolor='black')
axes[1, 0].set_title("Age Distribution")
axes[1, 0].set_xlabel("Age")
axes[1, 0].set_ylabel("Frequency")

# Plot 4: Survival count
axes[1,1].bar(df['Survived'].value_counts().index,
df['Survived'].value_counts(),color=['lightblue',
'lightcoral'])
axes[1, 1].set_title("Survival Count")
axes[1, 1].set_xlabel("Survived (0 = No, 1 = Yes)")
axes[1, 1].set_ylabel("Count")

# Plot 5: Fare vs Age
axes[2, 0].scatter(df['Age'],df['Fare'],
color='orange',edgecolors='black')
axes[2, 0].set_title("Fare vs Age")
axes[2, 0].set_xlabel("Age")
axes[2, 0].set_ylabel("Fare")

plt.tight_layout()
plt.show()
```

5.2.2. HISTOGRAM OF PASSENGER INFORMATION OF TITANIC

Write a Python code to plot a histogram for the distribution of the 'Age' column from the Titanic dataset. The histogram should display the frequency of different age ranges with the following specifications:

- 1. Use 30 bins for the histogram.
- 2. Set the edge color of the bars to black (k).
- 3. Label the x-axis as 'Age' and the y-axis as 'Frequency'.
- 4. Add the title "Age Distribution" to the histogram.

5.2.4. BAR PLOT FOR SURVIVAL BY GENDER

Write a Python code to plot a stacked bar chart that shows the count of passengers who survived and did not survive, grouped by gender, in the Titanic dataset. The chart should display the following specifications:

- 1. Group the data by the 'Sex' column, then use the value_counts() function to count the occurrences of survivors (0 = Did not survive, 1 = Survived) for each gender.
- 2. Use a stacked bar chart to display the survival counts.
- 3. Add the title "Survival by Gender" to the chart.
- 4. Label the x-axis as 'Gender' and the y-axis as 'Count'.
- 5. The legend should indicate 'Not Survived' and 'Survived'.

The Titanic dataset contains columns as shown below,

5.2.5. BAR PLOT FOR SURVIVAL BY PCLASS

Write a Python code to plot a stacked bar chart that shows the count of passengers who survived and did not survive, grouped by passenger class (Pclass), in the Titanic dataset. The chart should display the following specifications:

- 1. Group the data by the Pclass column and count the number of survivors (0 = Did not survive, 1 = Survived) for each class using value_counts().
- 2. Use a stacked bar chart to display the survival counts.
- 3. Add the title "Survival by Pclass" to the chart.
- 4. Label the x-axis as 'Pclass' and the y-axis as 'Count'.

Note:

- Refer to the visible test case for better reference.
- Ensure you use the groupby() function with value_counts() to count the survivors and non-survivors for each Pclass.
- Do not manually use size() or unstack() without value_counts(). Use the value_counts() method for counting survival status directly.

5.2.6. BAR PLOT FOR SURVIVAL BY EMBARKED

Write a Python code to plot a stacked bar chart showing the survival count for passengers based on their embarkation location in the Titanic dataset. The chart should display the following specifications:

- 1. Use the Embarked column to determine the embarkation location. After converting this column into dummy variables (using `pd.get_dummies()`), plot the survival count based on the Embarked_Q column (representing passengers who embarked from Queenstown) in relation to survival.
- 2. Set the chart type to 'bar' and make it stacked.
- 3. Add the title "Survival by Embarked " to the chart.
- 4. Label the x-axis as 'Embarked' and the y-axis as 'Count'.
- 5. Include a legend to distinguish between survivors and non-survivors (label the legend as 'Survived' and 'Not Survived').

The Titanic dataset contains columns as shown below,

5.2.9. BOX PLOT FOR FARE BY PCLASS

Write a Python code to plot a boxplot that shows the distribution of the 'Fare' column from the Titanic dataset based on the passenger class (Pclass). The boxplot should display the following specifications:

- 1. Use the Pclass column to group the data for the boxplot.
- 2. Set the title of the plot to "Fare by Pclass".
- 3. Remove the default subtitle with plt.suptitle("").
- 4. Label the x-axis as 'Pclass' and the y-axis as 'Fare'.

The Titanic dataset contains columns as shown below,

Pas sen ger Id	Sur viv ed	Pcl ass	Na me	Sex	Ag e	Sib Sp	Par ch	Tic ket	Far e	Ca bin	Em bar ked

5.2.10. SCATTER PLOT FOR AGE VS. FARE

Write a Python code to plot a scatter plot showing the relationship between the 'Age' and 'Fare' columns in the Titanic dataset. The scatter plot should display the following specifications:

- 1. Use the Age column for the x-axis and the Fare column for the y-axis.
- 2. Set the title of the plot to "Age vs. Fare".
- 3. Label the x-axis as 'Age' and the y-axis as 'Fare'.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

5.2.11. SCATTER PLOT FOR AGE VS. FARE BY SURVIVED

Write a Python code to plot a scatter plot showing the relationship between the 'Age' and 'Fare' columns in the Titanic dataset, with points color-coded by survival status. The scatter plot should display the following specifications:

- 1. Use the Age column for the x-axis and the Fare column for the y-axis.
- 2. Color the points based on the Survived column: Red for passengers who did not survive (Survived = 0). Blue for passengers who survived (Survived = 1).
- 3. Set the title of the plot to "Age vs. Fare by Survival".
- 4. Label the x-axis as 'Age' and the y-axis as 'Fare'.

The Titanic dataset contains columns as shown below,

Passenger Id	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked
